Material and Specification Control

- Wire is prepared from stainless steel rod under controlled material workflow.
- Incoming raw materials are reviewed before production through material review, wire-diameter checks, and mechanical-property control where required.
- Specifications, drawings, dimensions, application conditions, and technical questions are confirmed with the buyer before production.

Production and Inspection

- Forming, welding, assembly, and belt-structure control follow standardized production procedures.
- Defined checkpoints are used during production under the ISO 9001 quality system.
- Final QA may include dimensional accuracy, weld integrity, edge treatment, surface condition, product-specific function, and packing readiness.

Traceability and Audit Support

- Production and inspection information is retained by order, including material use, quantity, inspection notes, and shipment release status.
- Buyer audits and third-party inspections can be coordinated for long-term OEM cooperation, distributor evaluation, or quality-sensitive supply chains.

Privacy note: drawings, old belt photos, project dimensions, shipment photos, and buyer records are used only for technical review and quotation preparation. Public materials do not include customer names, order numbers, shipping marks, private labels, or faces.
